SMARTERN

TECHNICAL OVERVIEW: INTERN-OFFICE MATCHING FRAMEWORK

This document provides the administrative and technical foundation for the SmarTern "Smart Matching" algorithm. The framework utilizes a multi-criteria decision model to ensure mathematically objective placements by integrating quantitative skill metrics with qualitative behavioral evaluations.

1. THE CORE SCORING METHODOLOGY

The placement engine calculates compatibility through a weighted aggregation of an intern's proven capabilities and their professional assessment. This dual-focus approach ensures that technical proficiency is balanced by institutional suitability.

Final Score = (Skill Alignment × 80%) + (Behavioral Score × 20%)

- **Skill Alignment (80%):** An analysis of technical and soft skills mapped against priority-weighted office requirements.
- **Behavioral Score (20%):** Qualitative performance data captured during professional interviews.

2. DATA INTEGRITY & VERIFICATION

The system applies a "Triangle of Verification" to determine the reliability of skill data. Multipliers are applied based on the source of information, rewarding applicants whose skills have been externally validated.

DATA SOURCE	WEIGHT MULTIPLIER	CONFIDENCE LEVEL STANDARD
Supervisor Verified	**1.5x**	Highest Integrity: Explicitly confirmed during professional assessment.
Semantic Resume Match	**1.2x**	Validated: Identified via automated parsing of primary professional documents.
Self-Reported Data	**1.0x**	Baseline: Information provided by the intern during the initial onboarding process.

3. ALIGNMENT TIERS

Thresholds for placement recommendations follow established industrial-organizational competency benchmarks to guide immediate administrative action.

ALIGNMENT TIER	PERCENTAGE RANGE	ADMINISTRATIVE RECOMMENDATION
Strong Alignment	80% - 100%	Exceptional candidate; demonstrates strong synergy with office priorities.
Good Alignment	60% - 79%	Qualified candidate; possesses essential core competencies.
Fair Alignment	40% - 59%	Capable candidate; may benefit from targeted departmental guidance.
Limited Alignment	Below 40%	Low structural alignment with specific office requirements.

4. STANDARDS & ACADEMIC REFERENCES

METHODOLOGY COMPLIANCE & INDUSTRY STANDARDS:

ISO 10667-2:2020 — Assessment Service Delivery

This international standard establishes requirements for the delivery of assessments in organizational settings. SmarTern's use of multi-source verification and weighted scoring follows these guidelines for evidence-based decision-making.

Official ISO Standard: https://www.iso.org/standard/74717.html

Multi-Criteria Decision Analysis (MCDA) Framework

The AHP-TOPSIS-2N methodology (De Souza et al., 2018) is an established MCDA approach for structural evaluation and resource ordering. SmarTern's 80/20 weighted model is a practical application of these principles for optimal resource allocation.

SHRM Body of Applied Skills and Knowledge (BASK)

The Society for Human Resource Management (SHRM) advocates for the integration of behavioral competencies and technical skills to improve the validity of placement outcomes and reduce selection bias.
